Space Weather Forecast Headline: No significant activity expected.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity was Very Low, There is currently one sunspot region on the visible disc, in the southeast quadrant. No new Earth-directed CMEs (Coronal Mass Ejections) were observed in available imagery in the last 24 hours.

Solar Wind / Geomagnetic Activity: Solar winds started slow becoming elevated from 20/2330 UTC with current solar winds around 520 km/s. The important northwards/southwards direction was Weak and resultant geomagnetic activity remained Quiet (Kp 1-2).

Energetic Particles / Solar Radiation: No solar radiation storms were observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Solar activity is expected to be low or very low through the next few days, with an increase in flare probabilities as the anticipated new active region rotates into view on the southeast limb.

Solar Wind / Geomagnetic Activity: Solar winds are currently elevated. This is likely to continue over the next 24 hours, before slowly declining through Days 2 and 3 (22-23 Oct). Geomagnetic activity is likely to be Quiet to Unsettled, with isolated Active intervals on Days 1 and 2.

Energetic Particles / Solar Radiation: No solar radiation storms are expected.
